

24-V Input Voltage, 150-mA, Ultralow I_Q Low-Dropout Regulators

FEATURES

- **Wide Input Voltage Range: 2.5 V to 24 V**
- **Low 3.2- μ A Quiescent Current**
- **Ground Pin Current: 3.4 μ A at 100-mA I_{OUT}**
- **Stable with Any Capacitor (> 0.47 μ F)**
- **Available in SOT23-5 Package**
- **Operating Junction Temperature:
–40°C to +125°C**

APPLICATIONS

- **Ultralow Power Microcontrollers**
- **E-Meters**
- **Fire Alarms/Smoke Detector Systems**
- **Handset Peripherals**
- **Industrial/Automotive Applications**
- **Remote Controllers**
- **Zigbee™ Networks**
- **PDA's**
- **Portable, Battery-Powered Equipment**

DESCRIPTION

The TLV701xx series of low-dropout (LDO) regulators are ultralow quiescent current devices designed for extremely power-sensitive applications. Quiescent current is virtually constant over the complete load current and ambient temperature range. These devices are an ideal power management attachment to low-power microcontrollers, such as the [MSP430](#).

The TLV701xx operates over a wide operating input voltage of 2.5 V to 24 V. Thus, it is an excellent choice for both battery-powered systems as well as industrial applications that see large line transients.

The TLV701xx is available in a 3-mm × 3-mm SOT23-5 package that is ideal for cost-effective board manufacturing.

PRODUCT PREVIEW

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Zigbee is a trademark of ZigBee Alliance.

All other trademarks are the property of their respective owners.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

AVAILABLE OPTIONS⁽¹⁾

PRODUCT	V _{OUT}
TLV701xxyyyz	XX is nominal output voltage (for example, 30 = 3.0 V) YYY is Package Designator Z is Package Quantity

- (1) For the most current package and ordering information, see the Package Option Addendum at the end of this document, or visit the device product folder at www.ti.com.

ABSOLUTE MAXIMUM RATINGS⁽¹⁾

Over operating free-air temperature range, unless otherwise noted.

		VALUE		UNIT
		MIN	MAX	
Voltage ⁽²⁾	IN	-0.3	24	V
Current source	OUT	Internally limited		
Temperature	Operating junction, T _J	-40	+150	°C
	Storage, T _{stg}	-65	+150	°C
Electrostatic Discharge Rating ⁽³⁾	Human body model (HBM) QSS 009-105 (JESD22-A114A)		2	kV
	Charged device model (CDM) QSS 009-147 (JESD22-C101B.01)		500	V

- (1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to network ground terminal.
- (3) ESD testing is performed according to the respective JESD22 JEDEC standard.

THERMAL INFORMATION

THERMAL METRIC ⁽¹⁾		TLV701XX	UNITS
		DBV	
		5 PINS	
θ _{JA}	Junction-to-ambient thermal resistance	213.1	°C/W
θ _{JCtop}	Junction-to-case (top) thermal resistance	110.9	
θ _{JB}	Junction-to-board thermal resistance	97.4	
ψ _{JT}	Junction-to-top characterization parameter	22.0	
ψ _{JB}	Junction-to-board characterization parameter	78.4

PRODUCT PREVIEW

APPLICATION INFORMATION

The TLV701xx series of devices belong to a family of ultralow, I_Q , low-dropout (LDO) regulators. I_Q remains fairly constant over the complete output load current and temperature range. The devices are ensured to operate over a temperature range of -40°C to $+125^{\circ}\text{C}$.

INPUT AND OUTPUT CAPACITOR REQUIREMENTS

The TLV701 requires a 1- μF or larger capacitor connected between OUT and GND for stability. Ceramic or tantalum capacitors can be used. Larger value capacitors result in better transient and noise performance.

Although an input capacitor is not required for stability, when a 0.1- μF or larger capacitor is placed between IN and GND, it counteracts reactive input sources and improves transient and noise performance. Higher value capacitors are necessary if large, fast rise time load transients are anticipated.

BOARD LAYOUT RECOMMENDATIONS

Input and output capacitors should be placed as close to the device pins as possible. To avoid interference of noise and ripple on the board, it is recommended that the board be designed with separate ground planes for V_{IN} and V_{OUT} , with the ground plane connected only at the device GND pin. In addition, the ground connection for the output capacitor should be connected directly to the device GND pin.

POWER DISSIPATION AND JUNCTION TEMPERATURE

To ensure reliable operation, worst-case junction temperature should not exceed $+125^{\circ}\text{C}$. This restriction limits the power dissipation the regulator can handle in any given application. To ensure the junction temperature is within acceptable limits, calculate the maximum allowable dissipation, $P_{D(\text{max})}$, and the actual dissipation, P_D , which must be less than or equal to $P_{D(\text{max})}$.

The maximum power dissipation limit is determined using [Equation 1](#):

$$P_{D(\text{max})} = \frac{T_{J\text{max}} - T_A}{R_{\theta\text{JA}}} \quad (1)$$

where:

$T_{J\text{max}}$ is the maximum allowable junction temperature.

$R_{\theta\text{JA}}$ is the thermal resistance junction-to-ambient for the package.

T_A is the ambient temperature.

The regulator dissipation is calculated using [Equation 2](#):

$$P_D = (V_{\text{IN}} - V_{\text{OUT}}) \times I_{\text{OUT}} \quad (2)$$

Power dissipation that results from quiescent current is negligible.

REGULATOR PROTECTION

The TLV701xx series of LDO regulators use a PMOS-pass transistor that has a built-in back diode that conducts reverse current when the input voltage drops below the output voltage (for example, during power-down). Current is conducted from the output to the input and is not internally limited. If extended reverse voltage operation is anticipated, external limiting might be appropriate.

The TLV701xx features internal current limiting. During normal operation, the TLV701xx limits output current to approximately 250 mA. When current limiting engages, the output voltage scales back linearly until the overcurrent condition ends. Take care not to exceed the rated maximum operating junction temperature of $+125^{\circ}\text{C}$. Continuously running the device under conditions where the junction temperature exceeds $+125^{\circ}\text{C}$ degrades device reliability.

The ability to remove heat from the die is different for each package type, presenting different considerations in the printed circuit board (PCB) layout. The PCB area around the device that is free of other components moves the heat from the device to the ambient air. Using heavier copper increases the effectiveness in removing heat from the device. The addition of plated through-holes to heat-dissipating layers also improves heatsink effectiveness. Power dissipation depends on input voltage and load conditions. Power dissipation (P_D) is equal to the product of the output current and the voltage drop across the output pass element, as shown in [Equation 2](#).

PACKAGING INFORMATION

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSELETE: TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

RoHS Exempt: TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

Green: TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) **MSL, Peak Temp.** - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "-" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) **Lead finish/Ball material** - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.
