

## Dual Channel 12-Bit 900Mps Analog-to-Digital Converter

Check for Samples: [ADS5409](#)

### FEATURES

- Dual Channel
- 12-Bit Resolution
- Maximum Clock Rate: 900 Msps
- Low Swing Full-Scale Input: 1.0 Vpp
- Analog Input Buffer with High Impedance Input
- Input Bandwidth (3dB): >1.2GHz
- Data Output Interface: DDR LVDS
- Optional 2x Decimation with Low Pass or High Pass Filter
- 196-Pin BGA Package (12x12mm)
- KEY SPECIFICATIONS
  - Power Dissipation: 1.1W/ch
  - Spectral Performance at  $f_{in} = 230$  MHz IF
    - SNR: 61.0 dBFS
    - SFDR: 76 dBc
  - Spectral Performance at  $f_{in} = 700$  MHz IF
    - SNR: 59.4 dBFS
    - SFDR: 70 dBc

### APPLICATIONS

- Test and Measurement Instrumentation
- Ultra-Wide Band Software Defined Radio
- Data Acquisition
- Power Amplifier Linearization
- Signal Intelligence and Jamming
- Radar and Satellite Systems
- Microwave Receivers
- Cable Infrastructure
- Non-Destructive Testing

### DESCRIPTION

The ADS5409 is a high linearity dual channel 12-bit, 900 Msps analog-to-digital converter (ADC) easing front end filter design for wide bandwidth receivers. The analog input buffer isolates the internal switching of the on-chip track-and-hold from disturbing the signal source as well as providing a high-impedance input. Optionally the output data can be decimated by two. Designed for high SFDR, the ADC has low-noise performance and outstanding spurious-free dynamic range over a large input-frequency range. The device is available in a 196pin BGA package and is specified over the full industrial temperature range (–40°C to 85°C).

Device Part No.	Number of Channels	Speed Grade
ADS5402	2	800Msps
ADS5401	1	800Msps
ADS5404	2	500Msps
ADS5403	1	500Msps
ADS5407	2	500Msps
ADS5409	2	900Msps

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

This integrated circuit can be damaged by ESD. Texas Instruments recommends that all integrated circuits be handled with appropriate precautions. Failure to observe proper handling and installation procedures can cause damage.

ESD damage can range from subtle performance degradation to complete device failure. Precision integrated circuits may be more susceptible to damage because very small parametric changes could cause the device not to meet its published specifications.

## PIN ASSIGNMENTS

PIN		I/O	DESCRIPTION
NAME	NUMBER		
<b>INPUT/REFERENCE</b>			
INA_P/N	K14, L14	I	Analog ADC A differential input signal.
INB_P/N	E14, D14	I	Analog ADC B differential input signal.
VCM	B14	O	Output of the analog input common mode (nominally 1.9V). A 0.1µF capacitor to AGND is recommended.
VREF	A14	O	Reference voltage output (2V nominal). A 0.1µF capacitor to AGND is recommended, but not required.
<b>CLOCK/SYNC</b>			
CLKINP/N	P14, P13	I	Differential input clock
SYNCP/N	P9, N9	I	Synchronization input. Inactive if logic low. When clocked in a high state initially, this is used for resetting internal clocks and digital logic and starting the SYNCOUT signal. Internal 100Ω termination.
<b>CONTROL/SERIAL</b>			
SRESET	B12	I	Serial interface reset input. Active low. Initialized internal registers during high to low transition. Asynchronous. Internal 50kΩ pull up resistor to IOVDD.

**PIN ASSIGNMENTS (continued)**

PIN		I/O	DESCRIPTION
NAME	NUMBER		
ENABLE	B11	I	Chip enable – active high. Power down function can be controlled through SPI register assignment. Internal 50kΩ pull up resistor to IOVDD.
SCLK	A12	I	Serial interface clock. Internal 50kΩ pull-down resistor.
SDIO	A11	I/O	Bi-directional serial data in 3 pin mode (default). In 4-pin interface mode (register x00, D16), the SDIO pin is an input only. Internal 50kΩ pull-down.
SDENB	A13	I	Serial interface enable. Internal 50kΩ pull-down resistor.
SDO	A10	O	Uni-directional serial interface data in 4 pin mode (register x00, D16). The SDO pin is tri-stated in 3-pin interface mode (default). Internal 50kΩ pull-down resistor.
TESTMODE	B13	–	Factory internal test, do not connect
<b>DATA INTERFACE</b>			
DA[11:0]P/N	P3, N3, P2, N2, P1, N1, M4, M3, M2, M1, L4, L3, L2, L1, K4, K3, K2, K1, J4, J3, J2, J1, H4, H3	O	ADC A Data Bits 11 (MSB) to 0 (LSB) in DDR output mode. Standard LVDS output.
DB[11:0]P/N	E2, E1, D4, D3, D2, D1, C4, C3, C2, C1, B1, A1, B2, A2, B3, A3, B4, A4, B5, A5, B6, A6, B7, A7	O	ADC B Data Bits 11 (MSB) to 0 (LSB) in DDR output mode. Standard LVDS output.
DACLKP/N	H2, H1	O	DDR differential output data clock for Bus A. Register programmable to provide either rising or falling edge to center of stable data nominal timing.
DBCLKP/N	G2, G1	O	DDR differential output data clock for Bus B. Register programmable to provide either rising or falling edge to center of stable data nominal timing. Optionally Bus B can be latched with DACLKP/N.
SYNCOUTP/N	F2, F1, P5, N5	O	Synchronization output signal for synchronizing multiple ADCs. Can be disabled via SPI.
OVRAP/N	M5, L5	O	Bus A, Overrange indicator, LVDS output. A logic high signals an analog input in excess of the full-scale range. Optional SYNC output.
OVRBP/N	D5, C5	O	Bus B, Overrange indicator, LVDS output. A logic high signals an analog input in excess of the full-scale range. Optional SYNC output.
NC	E3, E4, F3, F4, G3, G4, N4, N6, N7, N10, P4, P6, P7, P10	–	Don't connect to pin
<b>POWER SUPPLY</b>			
AVDD33	D12, E12, F12, G12, H12, J12, K12, L12, N12, P12	I	3.3V analog supply
AVDDC	G14, H14	I	1.8V supply for clock input
AVDD18	D10, D11, E11, F11, G11, H11, J11, K11, L10, L11, N11, P11	I	1.8V analog supply
DVDD	A8, A9, B8, B9, C8, D8, L8, M8, N8, P8	I	1.8V supply for digital block
DVDDLVD	C6, C7, D6, D7, L6, L7, M6, M7	I	1.8V supply for LVDS outputs
IOVDD	B10	I	1.8V for digital I/Os
GND		I	Ground

	CLKINP, CLKINN	-0.5	AVDDC + 0.5	V
	SYNCP, SYNCN	-0.5	AVDD33 + 0.5	V
	SRESET, SDENB, SCLK, SDIO, SDO, ENABLE	-0.5	IOVDD + 0.5	V
Operating free-air temperature range, T <sub>A</sub>	-40	85	°C	
Operating junction temperature range, T <sub>J</sub>		150	°C	
Storage temperature range	-65	150	°C	
ESD, Human Body Model		2	kV	

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only and functional operation of these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

**THERMAL INFORMATION**

THERMAL METRIC <sup>(1)</sup>		ADS5409	UNITS
		nFBGA	
		196 PINS	
$\theta_{JA}$	Junction-to-ambient thermal resistance <sup>(2)</sup>	37.6	°C/W
$\theta_{JCTop}$	Junction-to-case (top) thermal resistance <sup>(3)</sup>	6.8	
$\theta_{JB}$	Junction-to-board thermal resistance <sup>(4)</sup>	16.8	
$\psi_{JT}$	Junction-to-top characterization parameter <sup>(5)</sup>	0.2	
$\psi_{JB}$	Junction-to-board characterization parameter <sup>(6)</sup>	16.4	
$\theta_{JCbott}$	Junction-to-case (bottom) thermal resistance <sup>(7)</sup>	N/A	

- (1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).
- (2) The junction-to-ambient thermal resistance under natural convection is obtained in a simulation on a JEDEC-standard, high-K board, as specified in JESD51-7, in an environment described in JESD51-2a.
- (3) The junction-to-case (top) thermal resistance is obtained by simulating a cold plate test on the package top. No specific JEDEC-standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.
- (4) The junction-to-board thermal resistance is obtained by simulating in an environment with a ring cold plate fixture to control the PCB temperature, as described in JESD51-8.
- (5) The junction-to-top characterization parameter,  $\psi_{JT}$ , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining  $\theta_{JA}$ , using a procedure described in JESD51-2a (sections 6 and 7).
- (6) The junction-to-board characterization parameter,  $\psi_{JB}$ , estimates the junction temperature of a device in a real system and is extracted from the simulation data for obtaining  $\theta_{JA}$ , using a procedure described in JESD51-2a (sections 6 and 7).
- (7) The junction-to-case (bottom) thermal resistance is obtained by simulating a cold plate test on the exposed (power) pad. No specific JEDEC standard test exists, but a close description can be found in the ANSI SEMI standard G30-88.

## RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

		MIN	NOM	MAX	UNIT
T <sub>J</sub>	Recommended operating junction temperature	105			°C
	Maximum rated operating junction temperature <sup>(1)</sup>	125			
T <sub>A</sub>	Recommended free-air temperature	-40	25	85	°C

(1) Prolonged use at this junction temperature may increase the device failure-in-time (FIT) rate.

## ELECTRICAL CHARACTERISTICS

Typical values at T<sub>A</sub> = 25°C, full temperature range is T<sub>MIN</sub> = -40°C to T<sub>MAX</sub> = 85°C, ADC sampling rate = 900MSPS, 50% clock duty cycle, AVDD33 = 3.3V, AVDDC/AVDD18/DVDD/DVDDLVD/IOVDD = 1.8V, -1dBFS differential input (unless otherwise noted).

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNITS
<b>ADC Clock Frequency</b>			100		900	MSPS
<b>Resolution</b>			12			Bits
<b>SUPPLY</b>

## DESCRIPTION

### POWER DOWN MODES

The ADS5409 can be configured via SPI write (address x37) to a stand-by, light or deep sleep power mode which is controlled by the ENABLE pin. The sleep modes are active when the ENABLE pin goes low. Different internal functions stay powered up which results in different power consumption and wake up time between the two sleep modes.

Sleep mode	Wake up time	Power Consumption Auto correction disabled	Power Consumption Auto correction enabled
Complete Shut Down	2.5 ms	7mW	7mW
Stand-by	100µs	7mW	7mW
Deep Sleep	20µs	435mW	570mW
Light Sleep	2µs	770mW	900mW

### TEST PATTERN OUTPUT

The ADS5409 can be configured to output different test patterns that can be used to verify the digital interface is connected and working properly. To enable the test pattern mode, the high performance mode 1 has to be disabled first via SPI register write. Then different test patterns can be selected by configuring registers x3C, x3D and x3E. All three registers must be configured for the test pattern to work properly.

First set HP1 = 0 (Addr 0x01, D01)

Register Address	All 0s	All 1s	Toggle (0xAAA => 0x555)	Toggle (0xFFF => 0x000)
0x3C	0x8000	0xBFFC	0x9554	0xBFFC
0x3D	0x0000	0x3FFC	0x2AA8	0x0000
0x3E	0x0000	0x3FFC	0x1554	0x3FFC

Register Address	Custom Pattern															
	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
x3C	1	0													0	0
x3D	0	0	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0	0	0
x3E	0	0													0	0

For normal operation, set HP1 = 1 (Addr 0x01, D01) and 0x3C, 0x3D, 0x3E all to 0.

### CLOCK INPUT

The ADS5409 clock input can be driven differentially with a sine wave, LVPECL or LVDS source with little or no difference in performance. The common mode voltage of the clock input is set to 0.9V using internal 2kΩ resistors. This allows for AC coupling of the clock inputs. The termination resistors should be placed as close as possible to the clock inputs in order to minimize signal reflections and jitter degradation.

Recommended differential clock driving circuit

Figure 37. Recommended Differential Clock Driving Circuit

## SNR AND CLOCK JITTER

The signal to noise ratio of the ADC is limited by three different factors: the quantization noise is typically not noticeable in pipeline converters and is 74dB for a 12bit ADC. The thermal noise limits the SNR at low input frequencies while the clock jitter sets the SNR for higher input frequencies.

$$\text{SNR}_{\text{ADC}}[\text{dBc}] = -20 \times \log \sqrt{\left(10 - \frac{\text{SNR}_{\text{Quantization\_Noise}}}{20}\right)^2 + \left(10 - \frac{\text{SNR}_{\text{ThermalNoise}}}{20}\right)^2 + \left(10 - \frac{\text{SNR}_{\text{Jitter}}}{20}\right)^2} \quad (1)$$

The SNR limitation due to sample clock jitter can be calculated as following:

$$\text{SNR}_{\text{Jitter}}[\text{dBc}] = -20 \times \log(2\pi \times f_{\text{IN}} \times t_{\text{jitter}}) \quad (2)$$

The total clock jitter (TJitter) has three components – the internal aperture jitter (100fs for ADS5409) which is set by the noise of the clock input buffer, the external clock jitter and the jitter from the analog input signal. It can be calculated as following:

$$T_{\text{Jitter}} = \sqrt{(T_{\text{Jitter,Ext.Clock\_Input}})^2 + (T_{\text{Aperture\_ADC}})^2} \quad (3)$$

External clock jitter can be minimized by using high quality clock sources and jitter cleaners as well as bandpass filters at the clock input while a faster clock slew rate improves the ADC aperture jitter.

The ADS5409 has a thermal noise of 61.5 dBFS and internal aperture jitter of 100fs. The SNR depending on amount of external jitter for different input frequencies is shown in the following figure.

### ANALOG INPUTS

The ADS5409 analog signal inputs are designed to be driven differentially. The analog input pins have internal analog buffers that drive the sampling circuit. As a result of the analog buffer, the input pins present a high impedance input across a very wide frequency range to the external driving source which enables great flexibility in the external analog filter design as well as excellent 50Ω matching for RF applications. The buffer also helps to isolate the external driving circuit from the internal switching currents of the sampling circuit which results in a more constant SFDR performance across input frequencies.

The common-mode voltage of the signal inputs is internally biased to 1.9V using 500Ω resistors which allows for AC coupling of the input drive network. Each input pin (INP, INM) must swing symmetrically between (VCM + 0.25V) and (VCM – 0.25V), resulting in a 1.0Vpp (default) differential input swing. The input sampling circuit has a 3dB bandwidth that extends up to 1.2GHz.

### OVER-RANGE INDICATION

The ADS5409 provides a fast over-range indication on the OVRA/B pins. The fast OVR is triggered if the input voltage exceeds the programmable overrange threshold and it gets presented after just 12 clock cycles enabling a quicker reaction to an overrange event. The OVR threshold can be configured using SPI register writes.

The input voltage level at which the overload is detected is referred to as the threshold and is programmable using the Over-range threshold bits. The threshold at which fast OVR is triggered is (full-scale × [the decimal value of the FAST OVR THRESH bits] /16). After reset, the default value of the over-range threshold is set to 15 (decimal) which corresponds to a threshold of 0.56dB below full scale (20\*log(15/16)).

## INTERLEAVING CORRECTION

Each of the two data converter channels consists of two interleaved ADCs each operating at half of the ADC sampling rate but  $180^\circ$  out of phase from each other. The front end track and hold circuitry is operating at the full ADC sampling rate which minimizes the timing mismatch between the two interleaved ADCs. In addition the ADS5409 is equipped with internal interleaving correction logic that can be enabled via SPI register write.

The interleaving operation creates 2 distinct and interleaving products:

- $F_s/2 - F_{in}$ : this spur is created by gain timing mismatch between the ADCs. Since internally the front end track and hold is operated at the full sampling rate, this component is greatly improved and mostly dependent on gain mismatch.
- $F_s/2$  Spur: due to offset mismatch between ADCs

The auto correction loop can be enabled via SPI register write in address 0x01 and resetting the correction circuit in addresses 0x03 and 0x1A. By default it is disabled for lowest possible power consumption. The default settings for the auto correction function should work for most applications. However please contact Texas Instruments if further fine tuning of the algorithm is required.

The auto correction function yields best performance for input frequencies below 250MHz.

### RECEIVE MODE: DECIMATION FILTER

Each channel has a digital filter in the data path as shown in [Figure 38](#). The filter can be programmed as a low-pass or a high-pass filter and the normalized frequency response of both filters is shown in [Figure 39](#).

Figure 38.

The decimation filter response has a 0.1dB pass band ripple with approximately 41% pass-band bandwidth. The stop-band attenuation is approximately 40dB.

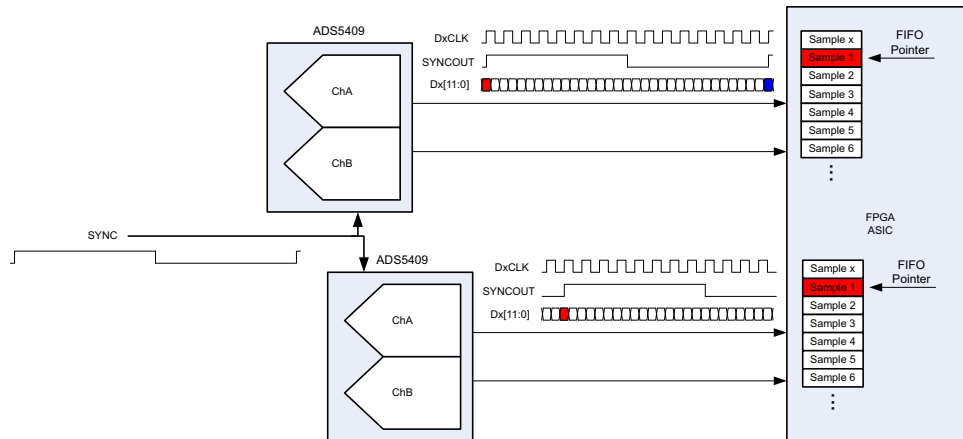

Figure 39.

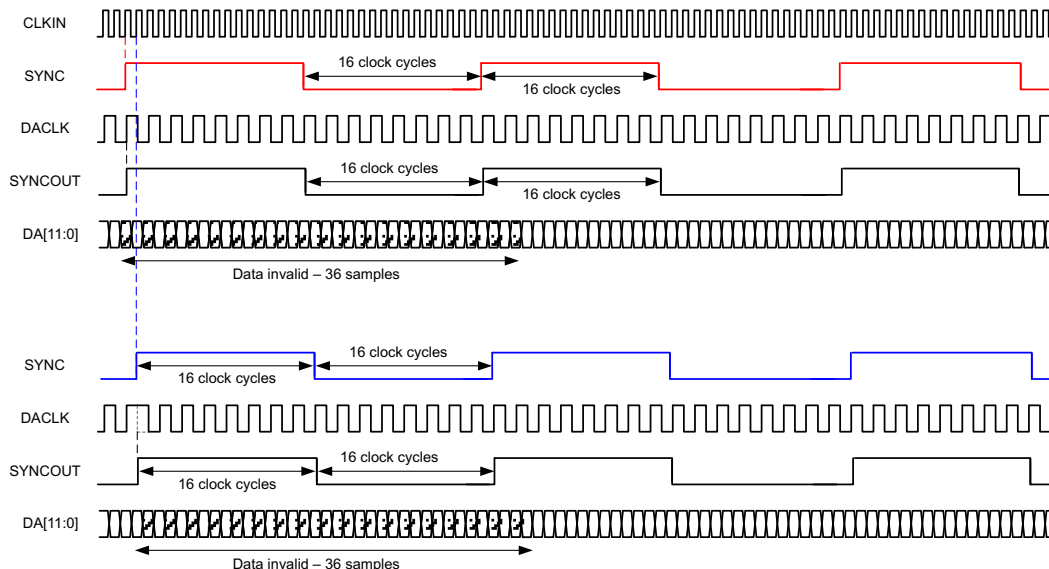

## MULTI DEVICE SYNCHRONIZATION

The ADS5409 simplifies the synchronization of data from multiple ADCs in one common receiver. Upon receiving the initial SYNC input signal, the ADS5409 resets all the internal clocks and digital logic while also starting a SYNCOUT signal which operates on a 5bit counter (32 clock cycles). Therefore by providing a common SYNC signal to multiple ADCs their output data can be synchronized as the SYNCOUT signal marks a specific sample with the same latency in all ADCs. The SYNCOUT signal then can be used in the receiving device to synchronize the FIFO pointers across the different input data streams. Thus the output data of multiple ADCs can be aligned properly even if there are different trace lengths between the different ADCs.

The SYNC input signal should be a one time pulse to trigger the periodic 5-bit counter for SYNCOUT or a periodic signal repeating every 32 CLKIN clock cycles. It gets registered on the rising edge of the ADC input clock (CLKIN). Upon registering the initial rising edge of the SYNC signal, the internal clocks and logic get reset which results in invalid output data for 36 samples (1 complete sync cycle and 4 additional samples). The SYNCOUT signal starts with the next output clock (DACLK) rising edge and operates on a 5-bit counter. If a SYNCIN rising edge gets registered at a new position, the counter gets reset and SYNCOUT starts from the new position.

Since the ADS5409 output interface operates with a DDR clock, the synchronization can happen on the rising edge or falling edge sample. Synchronization on the falling edge sample will result in a half cycle clock stretch of DA/BCLK. For convenience the SYNCOUT signal is available on the ChA/B output LVDS bus. When using decimation the SYNCOUT signal still operates on 32 clock cycles of CLKIN but since the output data is decimated by 2, only the first 18 samples should be discarded.

## PROGRAMMING INTERFACE

The serial interface (SIF) included in the ADS5409 is a simple 3 or 4 pin interface. In normal mode, 3 pins are used to communicate with the device. There is an enable (SDENB), a clock (SCLK) and a bi-directional IO port (SDIO). If the user would like to use the 4 pin interface one write must be implemented in the 3 pin mode to enable 4 pin communications. In this mode, the SDO pin becomes the dedicated output. The serial interface has an 8-bit address word and a 16-bit data word. The first rising edge of SCLK after SDENB goes low will latch the read/write bit. If a high is registered then a read is requested, if it is low then a write is requested. SDENB must be brought high again before another transfer can be requested. The signal diagram is shown below:

### Device Initialization

After power up, it is recommended to initialize the device through a hardware reset by applying a logic low pulse on the SRESETb pin (of width greater than 20ns), as shown in Figure 40. This resets all internal digital blocks (including SPI registers) to their default condition.

Figure 40. Device Initialization Timing Diagram

Table 1. Reset Timing

PARAMETER		CONDITIONS	MIN	TYP	MAX	UNIT
t <sub>1</sub>	Power-on delay	Delay from power up to active low RESET pulse	3			ms
t <sub>2</sub>	Reset pulse width	Active low RESET pulse width	20			ns
t <sub>3</sub>	Register write delay	Delay from RESET disable to SDENb active	100			ns

Recommended Device Initialization Sequence:

1. Power up
2. Reset ADS5409 using hardware reset.
3. Apply clock and input signal.
4. Set register 0x01 bit D15 to "1" (ChA Corr EN) and bit D9 to "1" (ChB Corr EN) to enable gain/offset correction circuit and other desired registers.
5. Set register 0x03 and 0x1A bit D14 to "1" (Start Auto Corr ChA/B). This clears and resets the accumulator values in the DC and gain correction loop.
6. Set register 0x03 and 0x1A bit D14 to "0" (Start Auto Corr ChA/B). This starts the DC and gain auto-correction loop.

### Serial Register Write

The internal register of the ADS5409 can be programmed following these steps:

1. Drive SDENB pin low
2. Set the R/W bit to '0' (bit A7 of the 8 bit address)

3. Initiate a serial interface cycle specifying the address of the register (A6 to A0) whose content has to be written
4. Write 16bit data which is latched on the rising edge of SCLK

Figure 41. Serial Register Write Timing Diagram

PARAMETER		MIN	TYP <sup>(1)</sup>	MAX	UNIT
$f_{SCLK}$	SCLK frequency (equal to $1/t_{SCLK}$ )	>DC		20	MHz
$t_{SLOADS}$	SDENB to SCLK setup time	25			ns
$t_{SLOADH}$	SCLK to SDENB hold time	25			ns
$t_{DSU}$	SDIO setup time	25			ns
$t_{DH}$	SDIO hold time	25			ns

(1) Typical values at +25°C; minimum and maximum values across the full temperature range: TMIN = -40°C to TMAX = +85°C, AVDD33 = 3.3V, AVDD, DRVDD = 1.9V, unless otherwise noted.

### Serial Register Readout

The device includes a mode where the contents of the internal registers can be read back using the SDO/SDIO pins. This read-back mode may be useful as a diagnostic check to verify the serial interface communication between the external controller and the ADC.

1. Drive SDENB pin low
2. Set the RW bit (A7) to '1'. This setting disables any further writes to the registers
3. Initiate a serial interface cycle specifying the address of the register (A6 to A0) whose content has to be read.
4. The device outputs the contents (D15 to D0) of the selected register on the SDO/SDIO pin
5. The external controller can latch the contents at the SCLK rising edge.
6. To enable register writes, reset the RW register bit to '0'.

**Figure 42. Serial Register Read Timing Diagram**

**SERIAL REGISTER MAP<sup>(2)</sup>**

(2) Multiple functions in a register can be programmed in a single write operation.

**D10-D7 Over-range threshold** The over-range detection is triggered 12 output clock cycles after the overload condition occurs. The threshold at which the OVR is triggered =  $1.0V \times [\text{decimal value of } \langle \text{Over-range threshold} \rangle] / 16$ . After power up or reset, the default value is 15 (decimal) which corresponds to a OVR threshold of 0.56dB below fullscale ( $20 \times \log(15/16)$ ). This OVR threshold is applicable to both channels.

- D15-D13 **LVDS Current Strength**      LVDS output current strength.  
 Default 110
  - 000      2 mA                  100    3 mA
  - 001      2.25 mA              101    3.25 mA
  - 010      2.5 mA                110    3.5 mA
  - 011      2.75 mA              111    3.75 mA
  
- D12-D11 **LVDS SW**      LVDS driver internal switch setting – correct range must be set for setting in D15-D13  
 Default 01
  - 01      2 mA to 2.75 mA
  - 11      3mA to 3.75mA
  
- D10-D9 **Internal LVDS Termination**      Internal termination  
 Default 00
  - 00      2 kΩ
  - 01      200 Ω
  - 10      200 Ω
  - 11      100 Ω
  
- D4 **DACLK EN**      Enable DACLK output buffer  
 Default 1
  - 0      DACLK output buffer powered down
  - 1      DACLK output buffer enabled
  
- D3 **DBCLK EN**      Enable DBCLK output buffer  
 Default 1
  - 0      DBCLK output buffer powered down
  - 1      DBCLK output buffer enabled
  
- D1 **OVRA EN**      Enable OVRA output buffer  
 Default 1
  - 0      OVRA output buffer powered down
  - 1      OVRA output buffer enabled
  
- D0 **OVRB EN**      Enable OVRB output buffer  
 Default 1
  - 0      OVRB output buffer powered down
  - 1      OVRB output buffer enabled

Register Address	Register Data															
	D15	D14	D13	D12	D11	D10	D9	D8	D7	D6	D5	D4	D3	D2	D1	D0
A7-A0 in hex																
66	LVDS Output Bus A EN															

- D15-D0    **LVDS Output Bus A EN**    Individual LVDS output pin power down for channel A  
 Default FFFF  
 0    Output is powered down  
 1    Output is enabled
- D15    Pins N7, P7 (no connect pins) which are not used and should be powered down for power savings
- D14    Pins N6, P6 (no connect pins) which are not used and should be powered down for power savings
- D13    SYNCOUTP/N (pins P5, N5)
- D12    Pins N4, P4 (no connect pins) which are not used and should be powered down for power savings
- D11-D0    corresponds to DA11-DA0

Register Address	Register Data

A7-A0 in hex																
67	LVDS Output Bus B EN															

- D15-D0    **LVDS Output Bus B EN**    Individual LVDS output pin power down for channel B  
 Default FFFF  
 0    Output is powered down  
 1    Output is enabled
- D15    Pins G3, G4 (no connect pins) which are not used and should be powered down for power savings
- D14    Pins F3, F4 (no connect pins) which are not used and should be powered down for power savings
- D13    SYNCOUTP/N (pins F1, F2)
- D12    Pins E3, E4 (no connect pins) which are not used and should be powered down for power savings
- D11-D0    corresponds to DB11-DB0

## REVISION HISTORY

Changes from Original (May 2013) to Revision A	Page
• Deleted text in last paragraph in INTERLEAVING CORRECTION section .....	23
• Changed second paragraph in MULTI DEVICE SYNCHRONIZATION section .....	25
• Deleted Register Initialization section and added Device Initialization section .....	26
• Changed Register Address 38 Bits D3 to D0 from 0 to 1 in SERIAL REGISTER MAP .....	29
• Changed Register Address 38 Bits D3 to D0 from 0 to 1 and add D3 to D0 Read back 1 .....	35
• Changed Register Address 66 D15-D10 to D15-D0 .....	37
• Changed Register Address 67 D15-D10 to D15-D0 .....	37

**PACKAGING INFORMATION**

Orderable Device	Status (1)	Package Type	Package Drawing	Pins	Package Qty	Eco Plan (2)	Lead finish/ Ball material (6)	MSL Peak Temp (3)	Op Temp (°C)	Device Marking (4/5)	Samples
ADS5409IZAY	ACTIVE	NFBGA	ZAY	196	160	RoHS & Green	SNAGCU	Level-3-260C-168 HR	-40 to 85	ADS5409I	<a href="#">Samples</a>
ADS5409IZAYR	ACTIVE	NFBGA	ZAY	196	1000	RoHS & Green	SNAGCU	Level-3-260C-168 HR	-40 to 85	ADS5409I	<a href="#">Samples</a>

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBsolete:** TI has discontinued the production of the device.

(2) **RoHS:** TI defines "RoHS" to mean semiconductor products that are compliant with the current EU RoHS requirements for all 10 RoHS substances, including the requirement that RoHS substance do not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, "RoHS" products are suitable for use in specified lead-free processes. TI may reference these types of products as "Pb-Free".

**RoHS Exempt:** TI defines "RoHS Exempt" to mean products that contain lead but are compliant with EU RoHS pursuant to a specific EU RoHS exemption.

**Green:** TI defines "Green" to mean the content of Chlorine (Cl) and Bromine (Br) based flame retardants meet JS709B low halogen requirements of <=1000ppm threshold. Antimony trioxide based flame retardants must also meet the <=1000ppm threshold requirement.

(3) MSL, Peak Temp. - The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) There may be additional marking, which relates to the logo, the lot trace code information, or the environmental category on the device.

(5) Multiple Device Markings will be inside parentheses. Only one Device Marking contained in parentheses and separated by a "~" will appear on a device. If a line is indented then it is a continuation of the previous line and the two combined represent the entire Device Marking for that device.

(6) Lead finish/Ball material - Orderable Devices may have multiple material finish options. Finish options are separated by a vertical ruled line. Lead finish/Ball material values may wrap to two lines if the finish value exceeds the maximum column width.

**Important Information and Disclaimer:**The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

**TRAY**

Chamfer on Tray corner indicates Pin 1 orientation of packed units.

\*All dimensions are nominal
